BookGUID will have a constraint to ensure that it always has a value when new rows are inserted into dbo.Book. You need to ensure that the new column is assigned a GUID for existing rows. Which four Transact-SQL statements should you use? (To answer, move the appropriate SQL statements from the list of statements to the answer area and arrange them in the correct order.)

Answer:

Explanation: Actually, in the real world, you don't have to use WITH VALUES at the end of the statement and it works just as well. But because the question specifically states which FOUR TSQL statements to use, we have to include it.

EmployeeID	LastName	FirstName	MiddleName	DateHired	Department	JobTitle	ReportsTo
------------	----------	-----------	------------	-----------	------------	----------	-----------

Column name	Description
EmployeeID(pk)	Uniquely identifies the employee record in the table Used throughout the database by all the other tables that reference the Employee table
EmployeeNum	An alphanumeric value calculated according to company requirements Has to be unique within the Employee table Exists only within the Employee table
DepartmentID	References another table named Department that contains data for each department in the company
ReportsToID	Contains the EmployeeID of the manager to whom an employee reports
ReportsToID	Contains the EmployeeID of the manager to whom an employee reports

Unless stated above, no columns in the Employee table reference other tables. Confidential information about the employees is stored in a separate table named EmployeeData. One record exists within EmployeeData for each record in the Employee table. You need to assign the appropriate constraints and table properties to ensure data integrity and visibility. On which column in the Employee table should you create a self-reference foreign key constraint? A. DateHiredB. DepartmentIDC. EmployeeIDD. EmployeeNumE. FirstNameF. JobTitleG. LastNameH. MiddleNameI. ReportsToID Answer: I QUESTION 103 You need to create a table named OrderDetails on a new server. OrderDetails must meet the following requirements:- Contain a new column named LineItemTotal that stores the product of ListPrice and Quantity for each row.- The calculation for a line item total must not be run every time the table is queried.- The code must NOT use any object delimiters. The solution must ensure that LineItemTotal is stored as the last column in the table. Part of the correct T-SQL statement has been provided in the answer area. Provide the complete code.

```
CREATE TABLE OrderDetails
(
  ListPrice money NOT NULL,
  Quantity int NOT NULL,
  )
```

Answer: CREATE TABLE OrderDetails(ListPrice money NOT NULL,Quantity int NOT NULL,LineItemTotal AS (ListPrice \* Quantity) PERSISTED) QUESTION 104 You have a database named Sales that contains the tables shown in the exhibit. (Click the Exhibit button.)

You have an application named Appl. You have a parameter named @Count that uses the int data type. App1 is configured to pass

@Count to a stored procedure. You need to create a stored procedure named usp\_Customers for App1 that returns only the number of rows specified by the @Count parameter. The solution must NOT use BEGIN, END, or DECLARE statements. Part of the correct T-SQL statement has been provided in the answer area. Provide the complete code.

```
CREATE PROCEDURE usp_Customers  
    @Count int  
AS  
    SELECT TOP (@Count) Customers.LastName  
    FROM Customers  
    ORDER BY LastName
```

Answer: CREATE PROCEDURE usp\_Customers @Count int SELECT TOP(@Count) Customers.LastName FROM Customers ORDER BY Customers.LastName QUESTION 105 You need to create a query that calculates the total sales of each OrderID from a table named Sales.Details. The table contains two columns named OrderID and ExtendedAmount. The solution must meet the following requirements:- Use one-part names to reference columns.- Start the order of the results from OrderID.- NOT depend on the default schema of a user.- Use an alias of TotalSales for the calculated ExtendedAmount.- Display only the OrderID column and the calculated TotalSales column. Provide the correct code in the answer area. Key Words:
